

# AI-Powered Travel Lead Assistant - Internship Assignment

---

## Overview

Travel companies get thousands of enquiries daily. Some users are just exploring. Others are genuine potential customers. Build an AI-powered Travel Assistant that talks naturally with users, understands their travel requirements, remembers context during the conversation, and detects when there is enough buying intent to qualify as a sales lead.

The goal is not just to answer travel questions. It is to detect intent, judge how valuable the opportunity is, and capture complete lead information (including contact details) for follow-up by a travel consultant.

---

## Tech Stack & Deliverables

- **Frontend:** React
- **Backend:** Node.js
- **AI Provider:** Any LLM API of your choice (Gemini, OpenAI, Claude, etc.) using your own free tier key
- **Storage:** Supabase or MongoDB
- **AI Orchestration:** LangChain or similar, if you find it useful. Not required.

### What to submit:

1. GitHub repo link with your code and a short README explaining your approach, especially your lead scoring logic
  2. Deployed link (optional, but good to have).
  3. 2 to 3 sample conversation transcripts with the resulting lead JSON, included in your README
  4. A Loom video, not more than 5 minutes, explaining your logic and showing the project running. (required)
- 

## Lead Detection & Qualification (Most Important Part)

This is the core of the assignment. The assistant should continuously judge whether the user is showing genuine buying intent, and gather any missing travel details naturally as the conversation goes on.

Do not ask for contact details too early. First understand what the user is looking for, then ask for name and phone number only once the user seems like a genuine potential customer.

Once you have enough information, including a name and phone number, the assistant should create a lead, score it, and store it.

How you detect intent, structure the conversation, and decide when a lead is ready to store is entirely up to you. This is the main part of the assignment we want to see your thinking on.

**Think through edge cases** such as:

- A user who shares contact info unprompted, very early in the conversation
- A user who shows interest but declines to give contact details
- A user whose interest seems to drop mid conversation
- Vague or incomplete details, like a trip date given as "sometime next year"

You do not need to solve every case perfectly. Just show that you have thought about how the assistant should behave.

---

## UI Requirement

Somewhere in the UI, show the fields captured so far for the current conversation (for example destination, dates, travellers, budget, name, phone, and so on, as they get filled in). This can be a simple side panel, a card, or any layout you prefer. The goal is for us to see, at a glance, what information the assistant has gathered at any point in the conversation, without having to read back through the full chat.

---

## Example Conversation

**User:** I'm planning a honeymoon in Bali this December.

**Assistant:** That's exciting! Approximately how many people will be travelling?

**User:** Two adults.

**Assistant:** Great! Do you already have a budget in mind?

**User:** Around Rs 2 lakh.

**Assistant:** Perfect. If you'd like a travel consultant to help with personalized packages, may I have your name and contact number?

**User:** Rahul Verma, +91 9999999999

The assistant now has enough information to create and store a qualified lead.

---

## Lead Information

Each captured lead should contain, wherever available:

**Customer:** Full Name, Phone Number, Email (optional), Conversation ID

**Travel:** Destination, Departure City, Travel Month or Dates, Number of Travellers, Budget, Trip Duration, Trip Type, Special Requirements

**AI Qualification:** Lead Score (0 to 100), Confidence (Low, Medium, or High), Reason for Qualification, Summary of Customer Requirements

## Sample Output

```
{
  "conversationId": "conv_18422",
  "customer": { "name": "Rahul Verma", "phone": "+91 9999999999", "email": "rahul.verma@gmail.com" },
  "travel": {
    "destination": "Bali", "departureCity": null, "travelDate": "December 2026",
    "travellers": 2, "budget": "Rs 2,00,000", "duration": null,
    "tripType": "Honeymoon", "specialRequirements": null
  },
  "qualification": {
    "leadScore": 95, "confidence": "High",
    "reason": "Destination, trip type, traveller count, budget, and contact details are complete.",
    "summary": "Couple planning a honeymoon to Bali in December with a Rs 2,00,000 budget."
  },
  "createdAt": "2026-07-18T10:32:00Z"
}
```

---

## Lead Scoring

The assistant should estimate how valuable the lead is, based on the conversation.

| Conversation                    | Expected Score |
|---------------------------------|----------------|
| "Tell me about Bali."           | 10             |
| "Suggest places in Europe."     | 25             |
| "Planning a honeymoon in Bali." | 60             |

| Conversation                                                | Expected Score |
|-------------------------------------------------------------|----------------|
| "Budget Rs 2 lakh, travelling in December."                 | 80             |
| "Need help booking for 2 adults, here's my contact number." | 95             |

The exact scoring logic is up to you. Explain your approach clearly in the README, including how you define Confidence and how it relates to the Lead Score.

---

## Evaluation Criteria

- 1. Quality of intent detection
- 2. Naturalness of conversation
- 3. Correctness of captured lead data
- 4. Edge case handling
- 5. Code quality
- 6. Clarity of README

If anything is unclear, make a reasonable assumption, write it down in your README, and continue. We care more about how you handle unclear situations than about getting every detail perfect.
